

Superstore Sales Data Analysis

This report presents an analysis of Superstore sales data using Python, SQL, and Power BI. The project focused on data cleaning, exploratory analysis, business analysis, visualization, and dashboard development. The analysis identified key sales, profit, order, customer, category, segment, and regional performance patterns. An automated Python pipeline was also developed to clean the dataset, calculate key performance indicators, and export the results to Excel.

Key insights

Technology is the highest-performing category by sales.

Consumer is the largest customer segment.

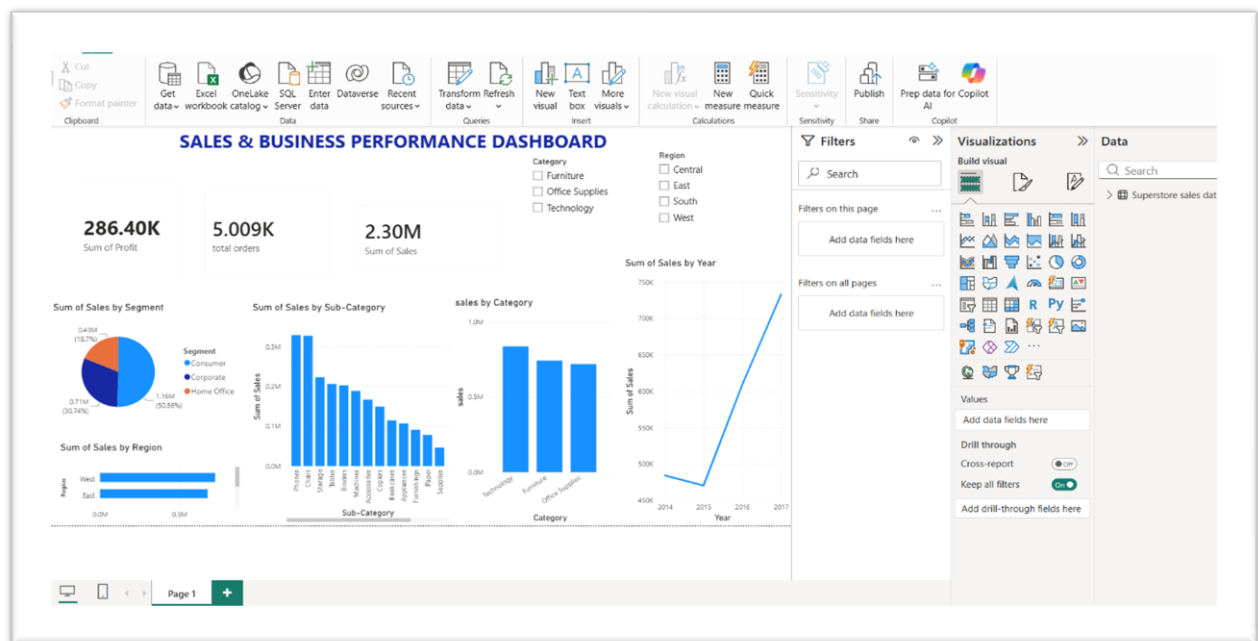

West region shows strong sales performance.

Sales increased significantly from 2015 to 2017.

Phones and Chairs are among the top-performing sub-categories.

The automated Python pipeline successfully cleaned the data and generated KPI reports.

Key performance indicators

Total Sales: 2.30M

Total Profit: 286.40K

Total Orders: 5.009K

Total Customers: 793

Conclusion

The Superstore sales analysis provides a clear view of overall business performance across sales, profit, orders, customers, categories, segments, and regions. The Power BI dashboard and automated Python pipeline help present the results clearly and support data-driven business decisions.

Business Recommendations

1. Focus on high-performing categories

Prioritize Technology and other high-performing sub-categories to improve sales and profitability.

2. Strengthen regional and customer strategies

Develop targeted strategies for the Consumer segment and strong-performing regions such as the West region.

3. Use data-driven monitoring

Continue using the Power BI dashboard and automated Python pipeline to regularly monitor KPIs and support business decisions
